

Session Title:

Rave Beyond EDC: Clinical Operations For a New Generation of Trials

Speaker(s):

Lisa Moneymaker, SVP Clinical Operations Technologies, Medidata

Date: May 24, 2022

Time: 2:00 PM - 2:30 PM

Abstract:

The evolution of data capture technology beyond EDC provides exciting opportunities to increase our understanding of the patient experience in a clinical trial. Because investigative sites now routinely interact physically and virtually with participants throughout a clinical trial, technology and processes must be employed to review study data and critical documents from anywhere. In this way, data is understood in context, and study teams with limited resources can maintain focus on the patient. Clinical operations strategies must adapt at the same pace as this data evolution, innovating intelligently to improve study timelines, reduce cost, and maintain quality. Here, we present a clinical operations platform driven by connected workflows and data-driven intelligence to accelerate a new generation of decentralized and hybrid clinical trials.

In this session, you will learn:

- The unique challenges decentralized clinical trials place on clinical operations teams
- The benefits of taking a holistic approach to managing data quality oversight
- How your teams can quickly realize faster study timelines and higher data quality by adopting risk-based approaches to trial execution
